Digital Celtic Topographies: An Exhaustive Analysis of Welsh and Manx Geolocated Linguistic, Folklore, and Manuscript Resources

The Digital Turn in Celtic Studies and the Spatial Paradigm

The intersection of digital humanities and Celtic linguistics has precipitated a profound transformation in how minority languages, historical manuscripts, and oral traditions are preserved, analyzed, and disseminated. Historically, the digitization of Celtic languages relied heavily on the development of robust, text-based computational infrastructures. This foundational era is epitomized by the resources cataloged within the DR-LIB CLARIN knowledge centre network, which includes essential corpora such as CorCenCC (the National Corpus of Contemporary Welsh) and the Gaelg Corpus Search. These text-centric databases provide the vital syntactic, lexical, and morphological bedrock required for computational linguistics, natural language processing, and deep philological study. However, contemporary technological paradigms within Celtic studies are increasingly shifting away from purely flat, text-based architectures toward dynamic, multi-dimensional models that prioritize spatial mapping, acoustic cartography, and high-resolution multimedia integration.

This evolution from textual corpora to geospatial multimedia repositories is vividly demonstrated by the sophisticated digital architectures already established for Irish and Scottish Gaelic. To identify and evaluate the equivalent digital resources for the Welsh (Brythonic) and Manx (Goidelic) languages, one must first establish a definitive comparative baseline derived from these existing Irish and Scottish models. Visual evidence from platforms such as *dúchas.ie*, *canuint.ie*, and *hiddenheritages.ai* reveals four distinct functional paradigms that represent the current zenith of digital Celtic studies:

Firstly, the dual-pane philological interface, as demonstrated by the Irish Schools' Collection on *dúchas.ie* (Image 1). This paradigm features a high-resolution, zoomable digitization of the original handwritten manuscript positioned directly alongside a standardized, searchable text transcription. Crucially, this interface is heavily enriched with metadata, tagging individual narratives with international folkloric classifications (such as the Aarne-Thompson-Uther AT0327 or AT0700 indices), alongside linguistic, geographic, and collector attribution data.

Secondly, the acoustic dialectological map, exemplified by the *Taisce Chanúintí na Gaeilge* (Image 2). This architecture utilizes an interactive web map of Ireland, populated with discrete geographic nodes. These nodes represent specific, highly localized audio recordings of native speakers, organized macroscopically by traditional provinces (Ulster, Connacht, Leinster,

Munster) and microscopically by specific townlands and parishes. This allows researchers to visually comprehend phonetic boundaries and regional morphological variations.
Thirdly, the transnational macro-folklore geographic information system (GIS), as seen in the *Hidden Heritages* platform (Image 3). This represents a highly dense, interactive mapping of thousands of folklore data points across both Ireland and Scotland. The interface allows users to filter immense datasets by format—distinguishing between raw manuscripts, transcribed texts, and audio files—while plotting the geographic spread of specific narrative motifs (e.g., "The Goat, the Fox and the Butter") across centuries and national borders.
Finally, the integrated multimedia archival hub, represented by the National Folklore Collection UCD Digitization Project on *dúchas.ie* (Image 4). This paradigm moves beyond the manuscript to consolidate disparate media formats into a unified digital ecosystem, integrating hundreds of thousands of manuscript pages with tens of thousands of ethnographic photographs and hundreds of hours of digitized acetate audio discs.
This report provides an exhaustive, multi-layered analysis of the digital landscapes of Wales and the Isle of Man, systematically evaluating their technological infrastructure against these four advanced Goidelic baselines. By examining high-resolution manuscript digitization efforts, advanced side-by-side transcription environments, open-source geospatial mapping platforms, acoustic dialectology archives, and geolocated folklore plotting, this analysis will determine the extent to which Brythonic and Manx digital heritage architectures meet or exceed the standards set by their Irish and Scottish counterparts.

Philological Interfaces: Manuscript Digitization and Parallel Transcription Architectures

The digitization of historical manuscripts serves as the fundamental prerequisite for advanced historical linguistics and literary analysis. The transition from accessing physical vellum in restricted reading rooms to engaging with digital surrogates online requires more than mere photographic reproduction; it necessitates the engineering of interactive, multi-layered digital environments that facilitate close reading, transcription, translation, and rigorous codicological analysis.

The National Library of Wales: Temporal Archival Galleries

The National Library of Wales (NLW) curates what is undeniably the most significant and comprehensive collection of Welsh manuscripts globally.[1] To manage this vast repository, the NLW has constructed a digital gallery that categorizes its digitized texts into distinct, navigable chronological eras: The Early Ages (pre-800 CE), The Middle Ages (c. 800–1500), the Early Modern Period (c. 1500–1800), and the Modern Period (post-1800).[1] This systematic temporal division mirrors the archival structures of major European digitization initiatives, allowing researchers to trace the morphological and orthographic evolution of the Welsh language from its nascent, fragmentary forms to its modern standardization.
Within this expansive digital architecture, the medieval collection stands out as a critical resource for Celticists. A paramount digital asset is the *White Book of Rhydderch* (Peniarth MS

4), an essential mid-14th-century compendium that preserves the earliest iterations of the *Mabinogion*, including foundational texts such as "The Four Branches of the Mabinogi," "Culhwch and Olwen," and "The Dream of Macsen Wledig".[4] The digital viewer utilized by the NLW features a high-resolution media interface equipped with advanced zoom capabilities, toggles for single and two-page viewing modes, and an index of visual thumbnails.[1] The resolution of these digital surrogates is sufficiently high to allow codicologists to examine the material structure of the vellum itself, including natural imperfections, the distinction between the hair and flesh sides of the parchment, and the pricking marks used by medieval scribes to rule the pages prior to writing.[5]

Furthermore, the NLW has digitized multiple iterations of the *Laws of Hywel Dda*. This includes the digitization of the Boston Manuscript (NLW MS 20143A)—a 14th-century portable pocket-book designed for use by itinerant lawyers—which provides unique visual data, including rare illustrations of a mermaid, a two-headed dragon, and decorative rubrication in red, blue, and green.[1] Other digitized milestones within the NLW repository include the *Book of Aneirin*, the *Book of Taliesin*, the *Black Book of Carmarthen*, the *Hengwrt Chaucer*, and the *Llanbeblig Book of Hours*.[1]

However, while the NLW interface offers unparalleled, open access to these high-resolution surrogates, its current digital architecture functions primarily as an advanced image repository and cataloguing system.[4] Unlike the interface demonstrated in Image 1 from *dúchas.ie*, the standard NLW digital gallery does not feature a natively integrated, side-by-side transcription and translation environment.[4] To locate parallel transcription architectures equivalent to the Irish Script on Screen (ISOS) or the Schools' Collection models, researchers must pivot from centralized national repositories to specialized, project-specific academic platforms developed by university consortia.

The Dafydd ap Gwilym Project: A Paradigm of Dual-Pane Philology

For an exact, and in many ways superior, functional equivalent to the advanced side-by-side transcription and translation viewers seen in the Irish digital landscape, the Dafydd ap Gwilym Project stands as the definitive Welsh architectural model. Funded by the Arts and Humanities Research Council (AHRC) and spearheaded by Swansea University in close collaboration with the Centre for Advanced Welsh and Celtic Studies, this digital repository provides an exhaustive, highly interactive electronic edition of the works of Dafydd ap Gwilym, widely regarded as the greatest Welsh poet of the Middle Ages.[6]

The digital architecture of the Dafydd ap Gwilym platform is uniquely sophisticated and tailored explicitly for rigorous philological engagement. Upon navigating the bilingual interface (which offers navigation in both Welsh and English) and selecting one of the 170 curated poems from the digital index, the user interface dynamically restructures itself, dividing the browser into two primary, interactive frames.[7]

The left-hand frame displays the master edited text of the poem in normalized Middle Welsh. Crucially, the interface features interactive, clickable lines. When a user or researcher selects a specific line of verse in the left frame, the right-hand frame immediately and dynamically populates with the corresponding raw manuscript readings.[8] This allows the user to instantly

view the orthographic and textual variations present across different historical manuscript copies, effectively automating the comparative process of textual criticism.[8]
Furthermore, the right-hand frame is highly modular and adaptable to the user's specific research needs. By utilizing navigation buttons arrayed across the bottom of the screen, users can toggle the right frame to display a modern Welsh paraphrase or a complete, scholarly English translation perfectly aligned alongside the original Middle Welsh text.[8] This directly mirrors the pedagogical and scholarly utility demonstrated in Image 1. Moving beyond simple text display, the Dafydd ap Gwilym database also integrates advanced computational visualization, specifically automated stemma generation. With a single click, the platform produces visual, hierarchical diagrams that map the genealogical relationships and transmission history between the various surviving manuscript copies of a given poem.[8] This dual-frame, interactive database represents the zenith of Welsh digital philology, completely fulfilling and expanding upon the requirements for a side-by-side transcription, translation, and codicological resource.

Early Insular Scholarly Networks: The Digitization of the Cambridge Juvencus

Digital manuscript repositories also serve to illuminate the deep historical intersections and intellectual networks connecting Brythonic and Goidelic scholars across the Irish Sea. The Cambridge Digital Library hosts the *Cambridge Juvencus* (CUL MS Ff.4.42), a pivotal 9th-century manuscript that contains the 'Juvencus Nine' and 'Juvencus Three'—widely recognized as the earliest surviving pieces of verse in Old Welsh.[9] These precious verses were added to the upper margins and flyleaves of an existing Latin text (a poetic reworking of the four gospels by the 4th-century poet Juvencus).[9] The precarious survival of the 'Juvencus Three' is notable; they were physically cut out of the manuscript by the 18th-century Welsh antiquary Edward Lhuyd, only to be discovered among his papers posthumously and eventually digitally and physically reattached to their rightful place.[9]
The high-resolution digitization of this manuscript reveals a fascinating reality of linguistic and cultural cross-pollination. The primary scribe of the main text signed his work using a highly revealing, hybridized formula: "Araut dianuadu" (A prayer for Núadu).[9] The name Núadu, combined with the specific Old Welsh orthography of the prayer, strongly indicates the presence of an Irish scribe operating within a Welsh scholarly scriptorium during the late 9th century.[9] Furthermore, the digitization exposes extensive marginalia and glosses written by thirteen subsequent scribes who interacted with the text in the following century. These scribes wrote seamlessly in Latin, Old Welsh, and Old Irish, providing concrete, digitizable evidence of a highly integrated, multilingual intellectual network linking Ireland and Wales during the early medieval period.[9] The digitization also highlights specific intellectual puzzles embedded within the text, such as a cryptogram written in Greek letters which, when decoded, reveals the Welsh name "Cymelliauc," demonstrating the complex scribal culture preserved within these digital surrogates.[9]

Feature / Resource	National Library of	Dafydd ap Gwilym	Irish Script on Screen

	Wales Digital Gallery	Project	/ Dúchas (Image 1)
Primary Content Focus	Broad historical collection (Laws, Mabinogion, Modern)	170 medieval cywyddau poems by Dafydd ap Gwilym	Irish folklore manuscripts, early Celtic manuscripts
Viewer Architecture	High-resolution image viewer (single/dual page zoom)	Split-screen interactive text frames	Split-screen image and text frames
Side-by-Side Transcription	Not natively integrated into the default viewer	Fully integrated (clickable lines link to variants)	Fully integrated (image alongside transcription)
Translation & Paraphrase	Dependent on external catalog metadata	Instant toggle for Modern Welsh and English	Often provided via metadata or external links
Advanced Codicological Tools	Ultra-violet simulation, pricking/ruling visibility	Stemma visualization, comprehensive manuscript variants	International folktale indexing (AT numbers)

Acoustic Cartography: The Spatial Mapping of Dialectology and Phonetics

The preservation and revitalization of minority languages require more than the digitization of silent texts; they demand the capture, preservation, and wide dissemination of phonetic realities. Both Wales and the Isle of Man possess highly distinct, geographically tethered dialectal variations. Interactive digital maps have therefore emerged as the primary mechanism for anchoring acoustic archives to their specific geographic origins, providing a direct equivalent to the dialectological audio maps demonstrated in Image 2 (*canuint.ie*).

Map Llais: The Crowdsourced Phonetic Mapping of Wales

In a direct effort to counteract the gradual Anglicization of Welsh topography and the erosion of local dialects, digital creator Dafydd Elfryn engineered *Map Llais* (Voice Map).[10] This interactive spatial tool is designed specifically to demonstrate and preserve the accurate, highly localized pronunciation of Welsh placenames.[10] The project addresses a pressing issue in heritage conservation: the phenomenon where traditional indigenous names are frequently replaced by English approximations or rendered unrecognizable by standardized, non-local pronunciations.[10]

The technical architecture of *Map Llais* relies on a sophisticated integration of crowdsourced acoustic data and open-source spatial plotting. The underlying audio files were originally collected by the Welsh Wicipedia team, who engaged in extensive field recordings within local communities across Wales to capture authentic, dialect-specific pronunciations directly from native speakers.[10] Elfryn recognized the geographic value of this data, extracting these open-source audio files from the Wicimedia database and meticulously mapping them to

precise geographic coordinates.[10]
The user interface of *Map Llais* is an exact functional equivalent to the *canuint.ie* interface shown in Image 2. Users navigate an interactive map of Wales populated with over 1,200 red geographic nodes.[10] Clicking on a specific node instantly triggers the localized audio file for that exact placename, allowing the user to hear the specific phonology of the region.[10] Initially focused on the historically Welsh-speaking strongholds of Gwynedd and Môn—areas the creator was intimately familiar with, facilitating easier initial mapping—the project is continually expanding.[10] Future iterations of the map aim to transcend municipal boundaries, adding precise geographic features such as individual mountains, lakes, and rivers across the entirety of the Welsh landscape.[10]

The Survey of Anglo-Welsh Dialects and Academic Sound Archives

The contemporary digital acoustic mapping of Wales is deeply underpinned by decades of rigorous, analog academic fieldwork. The foundations of this spatial linguistics were laid by scholars such as David Parry, who in 1968 initiated the Survey of Anglo-Welsh Dialects (SAWD).[11] Trained by the eminent dialectologist Harold Orton, Parry systematically mapped the distinctive English-language dialects across Wales, collecting massive amounts of primary audio evidence from informants throughout the country.[11] Similarly, Alan R. Thomas's seminal 1973 publication, *The Linguistic Geography of Wales*, established the academic baseline for understanding the spatial distribution of Welsh language dialects.[12]
Today, these historical mappings are being aggressively digitized and expanded. The archives of St Fagans National Museum of History, operating in close conjunction with the Department of Welsh at Cardiff University, hold an extraordinarily extensive collection of dialect speech.[14] Collecting oral testimonies systematically since 1957, the St Fagans sound archive now contains over 9,000 field recordings.[15] During the initial data collection phases, priority was deliberately given to informants residing in specific geographic regions where localized dialects and traditional lifestyles faced an imminent threat of extinction.[15]
This massive acoustic dataset, accompanied by physical and digital distribution maps of specific dialect features (such as the regional variations in vocabulary, e.g., the use of *llefrith* versus *llaeth* for milk in North versus South Wales), allows computational linguists to track the geographic retreat, preservation, or evolution of specific phonetic traits over a seventy-year continuum.[14] Contemporary researchers actively continue this spatial analysis. For instance, Dr. Iwan Wyn Rees utilizes digital recording booths deployed at the National Eisteddfod to map how internal migration patterns—such as North Walian and South Walian parents settling in urban centers like Cardiff or Aberystwyth—generate new, hybridized urban dialects among younger generations.[12] This creates a dynamic, continuously updating map of Welsh linguistic geography.

The Irish Folklore Commission and the Acoustics of Manx Gaelic

The Isle of Man presents a highly unique, and in many ways more fragile, case study in acoustic cartography. The modern revival of the Manx language (Gaelg) depends almost entirely on the

preservation and geospatial mapping of legacy audio recordings captured from the last generation of native speakers. The historical dialects of Manx were geographically bifurcated: Northern Manx (Gaelg Hwoaie) was spoken predominantly from Maughold in the northeast across to Peel on the west coast, while Southern Manx was concentrated in the sheading of Rushen in the south.[17]

The preservation of native Manx phonetics—and the ability to digitally map these north-south dialectal divides today—was secured through a dramatic and historically significant international intervention in the mid-20th century. During a visit to the island in the summer of 1947, the Irish Taoiseach Éamon de Valera (a fervent advocate for Celtic languages) met with Ned Maddrell, one of the last remaining native Manx speakers.[18] De Valera was alarmed to discover that the Manx museum lacked the necessary technological apparatus to record the voices of these final speakers before the language passed into silence.[18]

In response, de Valera ordered the immediate intervention of the Irish Folklore Commission. In 1948, the Commission dispatched an acoustic recording van to the Isle of Man, operated by Kevin Danaher.[18] The mobile recording unit, freshly unloaded from an Irish cattle boat and famously covered in cow dung, was equipped with a heavy disc-cutting apparatus capable of recording fifteen minutes of audio per side on massive sixteen-inch discs.[18] Danaher, assisted by locals Walter Clarke and Bill Radcliffe who managed the complex battery convertors and balanced the turntable using a carpenter's spirit level, traversed the island, ascending to remote geographic locales such as the farms in Ballaugh and Bride, and the southern village of Cregneash.[18]

This expedition successfully captured irreplaceable conversations, recitations, and hymns from the absolute final generation of native speakers, including individuals like Ned Maddrell, Tommy Leece, Eleanor Karran, and Harry Boyde.[19] These specific recordings represent the absolute baseline for all Manx phonetic data. Today, these historic audio files are fully digitized and hosted on platforms such as the iMuseum and Culture Vannin's audio archives.[19] While the Manx digital infrastructure does not currently feature a unified, interactive map interface as seamless as *Map Llais*, the metadata attached to these digitized recordings permanently anchors them to their specific geographic origins (e.g., Cregneash or Peel), forming the fundamental acoustic corpus that enables modern linguists and revivalists to map the historical sounds of the island.

Indigenous Toponymy and Open-Source Geographic Information Systems

In the context of minority languages, digital maps do vastly more than display locations; they encode power dynamics, historical erasure, and cultural primacy. Standardized, state-sponsored mapping systems, such as the Ordnance Survey (OS), have historically codified English terminology, often overwriting, corrupting, or entirely erasing indigenous Celtic place names. In response to this cartographic colonization, digital humanities projects in Wales have leveraged the power of open-source Geographic Information Systems (GIS) to actively reclaim the digital landscape, moving beyond the simple plotting of points to the engineering of

entirely new, linguistically sovereign basemaps.

Mapio Cymru: Engineering a Welsh-Language Basemap

To rectify the deep anglicocentric bias inherent in global digital mapping platforms (such as Google Maps or default OpenStreetMap), the *Mapio Cymru* project developed a comprehensive, dedicated Welsh-language version of OpenStreetMap (OSM).[23] Funded and supported by the Welsh Government's ambitious #Cymraeg2050 initiative—which aims to achieve one million regular Welsh speakers by 2050—the platform functions as an independent, fully interactive map of Wales that defaults exclusively to accurate Welsh nomenclature.[23]

The technical backend of Mapio Cymru is highly sophisticated and heavily reliant on open-data community collaboration. The map tiles are generated dynamically on a daily basis by prioritizing the name:cy and name tags within the vast OpenStreetMap database.[23] When the primary OSM data is found to be incomplete or missing a Welsh translation, the system automatically pulls supplementary data via the wikidata tag and cross-references this information with official open data provided by the Welsh Language Commissioner.[23]

Crucially, the platform extends its linguistic sovereignty beyond natural geographic features into the realm of modern civic infrastructure. Mapio Cymru actively integrates the National Public Transport Access Nodes (NaPTAN) dataset, allowing the map to display accurate Welsh names for highly granular infrastructure components such as individual bus stops, railway stations, and ferry ports utilizing the xml:lang="CY" attribute.[23] For example, a bus stop previously labeled solely as "Morriston Library" is corrected and displayed as "Llyfrgell Treforys".[23]

Furthermore, the project actively crowdsources the systematic auditing and correction of the OS Open Roads dataset. Volunteers compare official, often flawed datasets against physical street signs to correct orthographic errors, misplaced hyphens, and missing apostrophes in Welsh street names (e.g., correcting "DAN-Y-CASTELL" to the properly spaced "DAN Y CASTELL" or replacing English designations like "Peppercorn Lane" with the native "Lôn Bupren").[23] The utility of this map extends directly into daily civic life; it serves as the foundational basemap for the Welsh-language interface of the citizen-reporting tool FixMyStreet (cy.fixmystreet.com), allowing citizens to report local environmental issues—such as potholes or broken streetlights—using accurate, localized Welsh terminology rather than imposed English equivalents.[23] It has also been integrated into the Welsh Government's official "Data Map Wales" service, providing a flagship example of bilingual digital integration.[24]

The Gwynedd Welsh Place Names Map: Securing Micro-Toponymy

While Mapio Cymru focuses heavily on standardizing and displaying official municipal and infrastructure nomenclature, the *Gwynedd Welsh Place Names Map* targets a much more granular and fragile dataset: the preservation of micro-toponymy.[25] This refers to the informal, vernacular names for highly specific geographic features—fields, rocks, bends in a road, small coastal inlets—that are utilized daily by local communities but are entirely absent from formal Ordnance Survey maps. Developed by the Gwynedd Council's Language Unit under the

Indigenous Place Names Project, this interactive map operates as a living, digital repository of highly localized heritage.[25]

The interactive map visualizes this micro-data through a color-coded dot system, differentiating between streets, broader areas, geographical features, bridges, and specific agricultural fields.[25] The interface is designed for maximum community engagement; local users, schools, and historical societies can contribute their local knowledge by plotting a point, entering a detailed site description, providing the historical or folkloric background of the name, and attaching photographic evidence to the record.[25]

The data captured by this GIS interface is extraordinary, revealing deep, often dark layers of folklore, tragedy, and socioeconomic history tied to highly specific geographic coordinates. Notable entries preserved by the project include:

- **Allt Goch**: A specific stretch of the long hill road linking the A487 at Penygroes to the A499. While official maps provide no context for the name, the digital plot reveals the harrowing local legend: the road was named "Goch" (Red) because it was literally drenched in blood following a catastrophic and fatal horse and carriage accident centuries ago.[25]
- **Sianel Gw'r Nefyn**: A narrow, treacherous maritime channel situated in the seas off Belan and Dinas Dinlle. Last officially recorded on a maritime map by Lewis Morris in 1748, the name subsequently vanished from all modern cartography. However, the interactive map preserves its continuing use by local fishermen as a vital, safe navigational route that allows boats to circumvent the dangerous Caernarfon Bar.[25]
- **Stryd Llygod**: Officially designated as Mitre Place in the town of Pwllheli, the map restores and records its original vernacular name, "Mice Street," preserving the historical logic of its direct connection to the neighboring Stryd Moch ("Pig Street").[25]

Cynefin: Georeferencing Historical Topography

Complementing the preservation of oral micro-toponymy is the digital stabilization and spatial mapping of historical cartography itself. The *Cynefin: Mapping Wales' Sense of Place* project executed a massive, highly successful crowdsourced initiative to digitize, stitch together, and accurately georeference historic tithe maps across the entirety of Wales.[26] By utilizing thousands of volunteers to manually geotag historical maps and meticulously transcribe the accompanying handwritten apportionments, the project generated a seamlessly searchable, interactive historical map of Wales.[26] This allows contemporary researchers, ecologists, and linguists to overlay 19th-century land-use data and archaic, pre-industrial field names directly atop modern satellite imagery, creating a deep-map of Welsh territorial evolution and serving as a massive spatial repository for archaic Welsh agricultural vocabulary.[26]

Mapping Initiative	Primary Focus	Technological Infrastructure	Key Features & Integrations
Map Llais	Acoustic mapping of placenames	Wicimedia audio mapped to GIS	1200+ audio nodes featuring local dialect pronunciations
Mapio Cymru	Official	OpenStreetMap,	NaPTAN transport data

	Welsh-language basemap	name:cy priority tags	integration, FixMyStreet basemap
Gwynedd Place Names	Vernacular micro-toponymy	Custom interactive web map	Crowdsourced folklore, color-coded plots for fields/streets
Cynefin Project	Historical spatial mapping	Georeferenced raster mapping	Seamlessly stitched 19th-century tithe maps, text transcription

Geospatial Folklore: Digitizing Myth and Oral Tradition

In Celtic cultures, the landscape is rarely viewed merely as a physical, geological environment; rather, it serves as an immense, tangible canvas for mythographic narrative and historical memory. Features of the terrain—caves, glens, standing stones, and coastlines—are intimately associated with supernatural entities, historical trauma, and deep community identity. The digital plotting of these narratives serves to anchor highly ephemeral oral traditions to immutable geometric coordinates, providing direct equivalents to the dense folklore mappings seen in Image 3 (*hiddenheritages.ai*) and the multimedia archives in Image 4.

Culture Vannin and the Manx Geopoetic Landscape

On the Isle of Man, folklore remains an active, daily component of the modern cultural environment. The widespread practice of greeting the "Little People" (fairies) to avoid bad luck when traversing the Fairy Bridge on the A5 road, attributing sudden coastal fogs to the ancient sea god Manannan Mac-y-Lierr ("Manannan's Cloak" descending over the island), and recounting tales of "Jinny the Witch" during Hop Tu Naa (the Manx equivalent of Halloween) demonstrates the pervasive, living nature of Manx myth.[27]

To digitize, organize, and geolocate this deep connection to the landscape, Culture Vannin, operating in direct collaboration with UNESCO Biosphere Isle of Man and the island's literary community, developed the highly interactive *Poetry Map of the Isle of Man*.[29] The Poetry Map functions as a geospatial literary and folkloric archive, matching the interactive ethos of the Irish folklore maps. The digital interface displays a map of the island heavily populated with interactive pins.[31] Each pin correlates strictly to a specific geographic landmark, natural feature, or parish boundary, and contains a poem (restricted to forty lines or fewer) detailing the environment, wildlife, or specific folklore of that exact geometric coordinate.[29]

The geolocated literary works cover a vast array of Manx micro-regions, including coastal areas like Niarbyl Bay and Fenella Beach, historical structures like Peel Castle and the Tower of Refuge, and natural features like Snaefell and Colby Glen.[31] By tying the literary output of historic figures like the first Manx Bard T.E. Brown, alongside contemporary contributors, to precise map locations, Culture Vannin has successfully engineered a digital, geopoetic topography.[29] This interactive map actively encourages users to physically explore the island's

biosphere while engaging with its rich literary heritage.[30]
Further augmenting the Manx digital folklore landscape is the *Manx History App*, a sophisticated web-based mobile application funded by the Gough Ritchie Trust and Culture Vannin.[32] The application offers distinct thematic modules covering historical eras, significant figures, and specific geographic sites ranging from the ancient Keill Abban to the modern TT Grandstand.[32] Embedded within this application is the "History Mann" audio series, providing on-the-go, localized oral history narratives tied directly to the user's physical exploration of the island, merging physical travel with digital folklore.[32]

Unlocking Our Sound Heritage: The iMuseum Folklore Archive

The Manx National Heritage organization acts as the central custodian for the island's digital assets, overseeing the iMuseum. This centralized digital repository houses comprehensive archives of maps, plans, and historical records.[33] The digital maps and plans archive alone is a treasure trove of geospatial data, containing a vast array of archaeological site plans, detailed nautical charts, and early colored estate plans that pre-date standard Ordnance Survey mapping, thereby offering crucial visual data on archaic field names and pre-industrial land divisions.[34]
However, the most significant contribution to the spatialization of Manx folklore is the *Unlocking Our Sound Heritage* (UOSH) project.[36] Executed in a strategic partnership with National Museums Northern Ireland, this major preservation initiative successfully digitized approximately 600 rare, degrading acoustic assets from the Manx National Heritage Sound Archive.[36] The meticulous cataloging and complex rights-clearance process resulted in the online release of pristine audio recordings detailing hyper-local folklore, oral histories, and long-held superstitions.
Crucially, the UOSH collection explicitly maps oral traditions to specific topographies, mirroring the geospatial organization of the Irish collections. For example, researchers utilizing the iMuseum can access specific audio testimonies detailing the terrifying roar of a supernatural Buggane, a mythic beast whose lore is specifically anchored to the steep cliffs of Spanish Head.[36] Another geolocated acoustic record details the deeply held maritime superstition of local fishermen firing a bottle of rum deep into Black Head Cave to appease local spirits and guarantee a prosperous, safe fishing season.[36] By meticulously cataloging these audio files within the iMuseum's searchable database, the project transforms fluid, localized rumors and myths into fixed, highly accessible data points for ethnomusicologists, linguists, and cultural historians, directly fulfilling the multimedia archival paradigm established in Image 4.

People's Collection Wales: Federated Spatial Archives

While the Isle of Man utilizes a highly centralized digital architecture (curated almost entirely by the iMuseum and Culture Vannin), Wales employs a federated, heavily decentralized model best exemplified by *People's Collection Wales* (Casgliad y Werin Cymru).[37] This expansive, multi-institutional digital infrastructure aggregates content from major national bodies—including the National Library of Wales, the Royal Commission on the Ancient and

Historical Monuments of Wales, and Amgueddfa Cymru (National Museum Wales)—while also aggressively crowdsourcing material from local historical societies, minority communities, and individual citizens.[37]

The entire platform is inherently geospatial and heavily reliant on interactive mapping, making it the closest direct equivalent to the dense geographic interfaces seen in Image 3. The user interface features an interactive map equipped with robust, highly granular filtering mechanics. Users can isolate massive amounts of digital assets by querying specific data types, enabling them to filter the map to display only "sound" or "story" items.[40] Furthermore, the underlying taxonomy allows users to filter the map not just by location, but by geographical typologies, such as isolating data tagged to "Cities, Towns and Villages," "Farms and Smallholdings," "Islands," or "Mountains / Hills".[40]

This sophisticated, metadata-driven architecture permits a researcher to execute highly specific spatial queries. For example, one could locate all surviving audio recordings of folk tales associated with a specific Welsh island, or isolate oral histories regarding traditional agricultural practices within a defined mountainous region.[40] Additionally, the platform features an innovative "Interactive Story Builder." This tool empowers users to synthesize raw video, acoustic files, and images extracted from the repository into newly rendered, narrative timelines, effectively allowing local communities to curate, map, and reconstruct their own regional folklore digital exhibitions, ensuring that the archive remains a living, evolving entity rather than a static repository.[41]

Synthesizing the Celtic Digital Topography

An exhaustive analysis of the Brythonic and Goidelic digital landscapes reveals distinct, highly evolved methodologies in how these nations manage, structure, and deploy their digital heritage architectures to preserve their linguistic and cultural legacy.

The Welsh model is characterized by **decentralized, highly specialized federation**. No single platform attempts to host all data types. Manuscript philology is dominated by the National Library of Wales and university-led initiatives like the Dafydd ap Gwilym project, providing high-level codicological and translational tools that perfectly match the dual-pane interfaces of Irish Script on Screen. Acoustic mapping is handled by independent, grassroots initiatives like Map Llais, while official linguistic geography and civic mapping is fiercely defended by Mapio Cymru's open-source manipulations. The aggregation of these diverse streams occurs primarily through overarching portals like People's Collection Wales, which serves as a macroscopic spatial index allowing for dense geographic filtering of stories and sounds, directly answering the functional precedents set by *hiddenheritages.ai*.

Conversely, the Manx model relies on **institutional centralization**. Given the island's smaller geographical and demographic scale, Manx National Heritage and Culture Vannin act as the absolute, unified arbiters of digital data. The iMuseum serves as the single, centralized hub for archival texts, historical cartography, and the vast, culturally critical Unlocking Our Sound Heritage acoustic collection, which preserves the 1948 recordings that saved the language's phonetic history. While Manx resources currently lack a fully integrated, dual-frame side-by-side philological viewer equivalent to the Dafydd ap Gwilym project, their integration

of modern geographic tools—such as the interactive Poetry Map and the mobile-optimized Manx History App—demonstrates a highly effective, community-focused approach to linking folklore and language directly to the physical environment.

Ultimately, the digital architectures developed for the Welsh and Manx languages demonstrate that the preservation of Celtic heritage relies increasingly on the complex synthesis of text, acoustics, and geographic coordinate systems. The evolution from static digital imaging and text corpora to dynamic, interactive mapping reflects a fundamental shift in the digital humanities: cultural artifacts, whether a 14th-century Welsh cywydd or the localized audio of a Manx myth, are no longer viewed merely as objects to be read or heard, but as vital spatial phenomena to be navigated, mapped, and preserved within the digital topography of the twenty-first century.
