Comprehensive Framework for the Recovery of Digital Audit Trails, Biometric Data, and Multi-Agency Records Following a Misclassified Hate Crime

Introduction and Systemic Context

The intersection of healthcare information governance, law enforcement data processing, and victims' statutory rights forms a highly complex regulatory matrix. When a critical incident—such as the reporting of a hate crime—is misclassified or mishandled by statutory bodies, the resulting erroneous data footprint can propagate across multiple interconnected public sector databases. For a British national navigating the aftermath of such an event involving the Metropolitan Police Service (specifically Wood Green Police Station) and the North Middlesex University Hospital (now operating under the Royal Free London NHS Foundation Trust), the retrieval of all digital notes, system metadata, and biometric data is not merely an administrative exercise. It is a fundamental prerequisite for personal safety, legal remediation, memory restoration, and restorative justice.[1]

This comprehensive analysis details the precise legal, technical, and procedural methodologies required to extract every available digital artifact, audit trail, and metadata log generated during a specific interaction with these agencies. The analysis is grounded in the provisions of the UK General Data Protection Regulation (UK GDPR), the Data Protection Act 2018 (DPA 2018), the Police and Criminal Evidence Act 1984 (PACE), the Protection of Freedoms Act 2012 (PoFA), the Equality Act 2010, and the Code of Practice for Victims of Crime in England and Wales (the Victims' Code).[4]

Furthermore, because the data subject possesses a valid diagnosis of Complex Post-Traumatic Stress Disorder (C-PTSD), this report outlines how to legally compel these statutory agencies to operate strictly through digital communications. By invoking the Equality Act 2010, the data subject can mandate reasonable adjustments that eliminate the bureaucratic friction—often experienced as institutional "gaslighting"—that actively exacerbates trauma.[7] The subsequent sections detail how to secure absolute data transparency, halt imminent data-deletion protocols (such as the rigid 31-day auto-delete rule for Metropolitan Police 999 calls and Body Worn Video), trace the anomalous insertion of cross-border intelligence (such as Irish nationality and family data), and initiate the erasure of unlawfully obtained DNA and fingerprint data taken under false pretenses.[10]

Strategic Invocation of the Equality Act 2010 for Trauma-Informed Data Retrieval

The requirement to engage with large, opaque public bureaucracies following a traumatic event often presents significant cognitive and psychological barriers. For individuals with a diagnosed psychiatric condition such as Complex Post-Traumatic Stress Disorder (C-PTSD), repetitive questioning, extended administrative delays, and forced non-digital communications can trigger severe adverse psychological effects. The Equality Act 2010 provides a robust statutory mechanism to prevent this institutional abrasion.[8]

Complex Post-Traumatic Stress Disorder as a Protected Characteristic

Under the Equality Act 2010, disability is legally defined as a physical or mental impairment that has a "substantial and long-term adverse effect" on an individual's ability to carry out normal day-to-day activities.[13] Complex PTSD unequivocally meets this threshold. The legislation protects disabled individuals from both direct and indirect discrimination, imposing an "anticipatory duty" on public sector organizations, including NHS Trusts and Police forces, to make "reasonable adjustments" to their standard operating procedures.[9]

This anticipatory duty means that an organization cannot simply rely on its standard, rigid administrative workflows if those workflows place a disabled person at a substantial disadvantage. Instead, the organization must proactively alter its policies, practices, and physical or digital environments to ensure equitable access to services, which explicitly includes the facilitation of statutory rights such as Subject Access Requests (SARs).[8]

Mandating Digital-Only Communications and Prohibiting Administrative Friction

The data subject's requirement for all communications to be conducted entirely digitally, alongside a firm demand to cease extended questioning designed to artificially delay the process, constitutes a highly specific, legally enforceable request for reasonable adjustments.[9] Public authorities are legally obligated to alter their communication modalities to prevent a disabled person from being placed at a substantial disadvantage.[9]

When submitting a Subject Access Request or a Right of Access request, the inclusion of a formal declaration invoking the Equality Act 2010 serves a critical dual purpose, fundamentally altering the legal dynamic between the citizen and the state apparatus:

Strategic Purpose	Legal Mechanism and Implementation
Establishing the Digital Communication Mandate	It legally compels the respective Data Protection Officers (DPOs) to accept digitally transmitted identification (e.g., a scanned passport attached to an email) and to return all responsive data via a secure digital portal or

	encrypted email. This overrides any standard organizational preference for physical mail, wet-ink signatures, or in-person verification, which are common bureaucratic hurdles.[16]
Preventing Systemic Gaslighting and Administrative Delay	It preemptively strikes down attempts by the organization to "stop the clock" on the statutory one-month SAR response time through requests for superfluous clarification. The UK GDPR explicitly states that data controllers must facilitate the exercise of data subject rights (Article 12); artificially extending the process under the guise of "verification" violates both data protection law and the Equality Act 2010.[19]

Implementing the Reasonable Adjustment Digital Flag (RADF) within the NHS

Within the National Health Service infrastructure, there exists a specific technological mechanism designed to enforce these rights universally. The "Reasonable Adjustment Digital Flag" on the NHS Spine enables health and care workers to record, share, and view details of a patient's reasonable adjustments across all NHS settings.[21] This Fast Healthcare Interoperability Resources (FHIR) software interface ensures that a patient's need for specialized communication (such as trauma-informed, digital-only contact) is immediately visible to reception, administrative, and clinical staff whenever the patient's record is accessed.[21]
The data subject is legally entitled to demand that this flag be permanently updated within their NHS record. Doing so ensures future compliance across the National Care Records Service (NCRS), mitigating the need to continuously re-explain their disability or fight for digital communication formats during subsequent interactions with healthcare providers.[21]

The Victims' Code, Misclassification of Hate Crimes, and Crown Prosecution Service Implications

The systemic failure to properly identify and process a hate crime, resulting in the victim being incorrectly labeled as suffering from a "mental illness" or a "drug-induced psychosis", represents a severe and highly actionable breach of statutory duty.[4] This fabricated narrative—invented despite the data subject possessing a validated Complex PTSD diagnosis, consuming only clean and legal supplements, having no criminal history, and possessing a blood test definitively proving no drugs were in their system—not only endangers the individual but severely wastes public resources and leaves the actual perpetrators free to re-offend, thereby placing the wider public at risk.

Enhanced Statutory Rights for Hate Crime Victims

In England and Wales, the Code of Practice for Victims of Crime (commonly referred to as the Victims' Code) sets out the minimum standards that criminal justice agencies, including the Metropolitan Police and the Crown Prosecution Service (CPS), must provide to victims of crime.[5] Crucially, victims of hate crimes are legally eligible for "Enhanced Rights" under this code.[4] These enhanced protections include accelerated timescales for communication, priority referrals to specialist support services, and highly tailored support mechanisms throughout the investigation and judicial process.[4]

By misclassifying a hate crime as an episode of mental illness or drug-induced psychosis, the responding officers at Wood Green Police Station not only deprived the data subject of these enhanced statutory protections but fundamentally altered the entire trajectory and legality of the investigation. The Victims' Code establishes several specific, actionable rights that are highly relevant to the data subject's objective of correcting the narrative:

Victim Right	Implication of Police Failure
Right 1: To be able to understand and to be understood	This right intersects directly with the Equality Act 2010 duties regarding C-PTSD. The failure of officers to accurately comprehend and record the hate crime, substituting their own erroneous narrative of a psychiatric episode, violates this fundamental right.[5]
Right 2: To have the details of the crime recorded without unjustified delay	By recording a false allegation of drug-induced psychosis or mental illness instead of the reported hate crime, the police failed to record the actual crime, resulting in an ongoing, unjustified delay.[5]
Right 4: To be referred to services that support victims and have services tailored to needs	The misclassification inherently blocked the data subject from accessing specialist hate crime support networks, exacerbating the trauma of the event.[5]

Crown Prosecution Service (CPS) Engagement and Resource Waste

The data subject correctly identifies that this mishandling must be discussed with the Crown Prosecution Service. The CPS relies entirely on the accuracy, integrity, and objectivity of the evidence gathered by the police. When police officers take the initiative to "misremember what went wrong" and insert paraphrased, biased narratives into the digital file, they corrupt the evidentiary chain.

By gathering every single piece of metadata, the data subject can present a mathematically verifiable timeline to the CPS. This timeline will demonstrate how the initial 999 call reporting a hate crime was systematically distorted through successive shifts of officers and care teams into a false narrative of drug-induced psychosis. Proving this systemic failure highlights to the

CPS that pursuing any actions based on the contaminated police file is not only factually baseless but fails the "public interest" test, as it represents a severe waste of public prosecutorial resources while ignoring the genuine hate crime.

Systemic Contamination via Cross-Border and Inter-Agency Data Sharing

The data subject notes the highly concerning and inexplicable introduction of random secondhand information regarding their family and previous life in Ireland, tied to their dual Irish nationality. This indicates a sophisticated and potentially unlawful level of data querying by the responding agencies.

When police officers respond to an incident, they frequently conduct real-time intelligence queries on the Police National Computer (PNC) or the Police National Database (PND).[24] The PND is designed to link disparate events, intelligence reports, and cross-jurisdictional data across all UK forces and sometimes international databases.[25] If an officer queried the data subject's name and pulled in historical intelligence or familial data from Irish authorities or previous background checks, and allowed this unrelated data to prejudice their handling of the current hate crime report, this constitutes a severe breach of data processing principles (specifically, the principle of data minimization and relevance under the DPA 2018).

Furthermore, if the data subject is incorrectly recorded as experiencing a drug-induced psychosis, this erroneous flag is entered back into the PND, propagating "bad data" that taints all future interactions with the state.[25] Extracting the audit logs of these specific database queries is vital to proving that external, irrelevant historical data was unlawfully utilized to frame the incident.

Extracting Comprehensive Medical Records, System Metadata, and Audit Trails

The retrieval of health records from North Middlesex University Hospital requires a deeply nuanced understanding of recent NHS administrative restructuring and the underlying relational database architecture of modern electronic health records (EHRs).

Administrative Context: The Royal Free London NHS Foundation Trust Merger

A critical operational detail is that as of January 1, 2025, North Middlesex University Hospital NHS Trust was formally acquired by the Royal Free London NHS Foundation Trust.[1] Consequently, North Middlesex University Hospital no longer exists as an independent statutory authority for the purposes of Freedom of Information (FOI) or Subject Access Requests (SARs).[26]

Attempting to submit requests to outdated North Middlesex web portals or legacy email addresses will result in delivery failures or ignored communications, extending the data subject's distress.[28] All Subject Access Requests pertaining to clinical care, psychiatric

evaluations, or A&E triage received at the North Middlesex site must now be directed to the Information Governance team at the Royal Free London NHS Foundation Trust.[2] The request must explicitly name the North Middlesex site to ensure the DPO queries the correct localized databases.

Formulating the NHS Subject Access Request for Total Digital Transparency

Under Article 15 of the UK GDPR, the data subject possesses the unalienable right to obtain confirmation as to whether personal data concerning them is being processed, and, where that is the case, full access to the personal data and all supplementary information.[19] For healthcare organizations, a valid SAR does not legally require the use of a specific, proprietary form, despite hospital trusts frequently attempting to force patients to use cumbersome online portals or physical paper applications.[18]

To satisfy the data subject's requirement for a seamless, low-friction digital process under the Equality Act, a comprehensive email containing scanned passport identification and proof of address is legally sufficient and must be processed by the Trust.[18] Relevant digital contact points for the Royal Free London NHS Foundation Trust include the Data Protection Lead (info@royalfreecharity.org) or specific regional Information Governance emails associated with the North Central London Integrated Care Board.[31]

Beyond Clinical Notes: The Legal Demand for System Metadata and Audit Trails

The core of the data subject's query involves uncovering "who made which comment on a file when if there were edits" and determining precisely how paraphrasing by successive shifts of hospital care teams resulted in a distorted clinical narrative. Standard medical record disclosures are grossly insufficient for this purpose. Usually, a hospital's records department will run a script that generates a "flattened" PDF of the final clinical notes, completely omitting the underlying relational data, edit histories, and authorship tracking.[16]

To expose the exact chronology of edits and the identities of every staff member involved in the corruption of the narrative, the Subject Access Request must explicitly demand the extraction of **system metadata and full audit trails**.[34]

Metadata Category	Purpose and Relevance for the Data Subject
System Audit Logs	Modern NHS EHR systems (such as Cerner, EMIS, or System C) maintain rigorous internal accountability mechanisms.[36] An audit trail will reveal the precise timestamp, the user ID (identifying the specific doctor, nurse, or administrator), and the specific terminal used every single time the patient's file was opened, modified, or closed.[34] This proves exactly who

	looked at the file and when.
Versioning and Edit Histories	When clinical notes are altered or paraphrased during a shift handover, the database does not overwrite the old data; it stores the previous versions as historical strings. The SAR must explicitly state: *"I require all historical versions, drafts, and edit logs of clinical notes, rather than solely the final flattened PDF output."*.[33] This will provide the exact text of the notes before they were incorrectly paraphrased.
The London Care Record (LCR) Access Logs	North Middlesex University Hospital and the Royal Free London are both major data contributors to the London Care Record, a massive health information exchange that broadcasts patient summaries across the capital's healthcare network.[38] Erroneous notes recorded at North Middlesex may have been instantly broadcast to this wider network. The LCR system maintains its own strict audit reports.[38] Requesting these logs will reveal if other external agencies viewed the contaminated data.

Extracting Police Records, 999 Audio, CAD Logs, and Custody Data

Retrieving comprehensive data from the Metropolitan Police Service (MPS), specifically relating to the arrest and detention at Wood Green Police Station, involves navigating both the UK GDPR and Part 3 of the Data Protection Act 2018, which strictly governs data processing for law enforcement purposes.[40] The police data landscape is notoriously difficult to navigate, and the MPS utilizes aggressive data retention and deletion policies that actively threaten the data subject's ability to recover their records.

The Imminent Threat of Data Deletion: 999 Calls and Body-Worn Video

The most highly sensitive and evidentially critical artifacts in this scenario are the raw audio recording of the 999 call and the Body-Worn Video (BWV) footage captured by the responding police officers. The data subject astutely noted that officers in positions of power have a habit of "misremembering what went wrong." BWV footage and raw 999 audio provide unassailable, objective evidence of the initial interaction, the original reporting of the hate crime, the demeanor of the officers, and the subsequent unlawful arrest under false pretenses. However, the Metropolitan Police Service policy dictates aggressive auto-deletion protocols designed to manage server storage limits and reduce liability. **Non-evidential 999 audio and**

standard Body-Worn Video footage are automatically deleted after a maximum of 31 days unless they are manually flagged for retention by an officer.[11]
Because the responding officers falsely labeled the data subject as suffering from a drug-induced psychosis or mental illness, they very likely did not categorize the BWV footage as "required for evidence" in relation to a hate crime investigation. Consequently, the MPS system's automated script will permanently purge this footage at the 31-day mark.[12] Therefore, the absolute highest priority action the data subject must take is to issue an immediate, legally binding **Data Preservation Notice** alongside their SAR, explicitly demanding that the automated deletion of all CAD, 999, and BWV records related to the specific date, time, and location be halted pending legal review and a potential complaint to the Professional Standards Department.[12]

Decoding the Computer Aided Dispatch (CAD) Log

The CAD log is the master operational timeline of any police incident. From the exact second the 999 call is answered, the control room operator inputs live text detailing the caller's statements, officer dispatch times, and radio traffic updates broadcast from the scene.[44]
Crucially, the CAD log contains vital systemic metadata regarding how the incident was initially coded upon receipt (e.g., coded as a hate crime vs. coded as a mental health crisis or drug-induced psychosis). If the CAD log shows the incident was dispatched as a hate crime, but the arresting officers subsequently changed the narrative upon arrival, this provides definitive proof of the officers "taking their own initiative" to mishandle the event. Requesting the complete, unredacted CAD log is a standard and necessary procedure within an MPS Right of Access request.[24]

Custody Records and PACE Code C Compliance

Following the arrest under false pretenses, the data subject was transported to Wood Green Police Station and locked in a cell. The Police and Criminal Evidence Act 1984 (PACE) Code C provides a strict, statutory framework governing the detention, treatment, and questioning of persons by police officers.[46]
A formal Custody Record is electronically generated the moment a detainee arrives at the police station booking desk.[48] This electronic document (historically managed on systems like NSPIS, and increasingly on the new Connect system) [46] acts as a minute-by-minute ledger of the detainee's entire time in police custody. It is a highly detailed document that includes:

- The exact time of arrival and the formal authorization of detention by the Custody Sergeant.
- The stated grounds for detention (which will reveal exactly what lies or false pretenses the arresting officers presented to the Sergeant to justify the arrest).
- Records of all risk assessments, medical interventions, mental health observations, and the provision of meals.[48]
- Logs detailing any requests made by the detainee for an appropriate adult, medical attention, or legal counsel, and whether those requests were granted or denied.[46]

Crucially for the data subject, the electronic Custody Record contains an in-built, unalterable

audit trail. If officers subsequently altered their justification for the arrest after the fact, the system metadata will permanently reflect the timestamp and the unique user ID of the officer making the post-hoc edit. The data subject must explicitly request *"the full, unredacted electronic Custody Record, including all systemic metadata and chronological audit logs."*.[48]

Submitting the Right of Access Request to the Metropolitan Police

The Metropolitan Police Service processes all Right of Access requests centrally through the MPS Data Office.[45] While the MPS heavily promotes the use of a specific physical form (Form 3019) [51], an emailed request containing the requisite identification (a scan of the passport and a recent proof of address) is entirely legally binding under the UK GDPR and must be accepted, particularly when combined with the Equality Act 2010 mandate for digital communication.[20] The comprehensive email should be directed to the official Data Rights channel (DataRights@met.police.uk).[53] To satisfy the legal requirement for specificity and avoid the DPO rejecting the request as "manifestly unfounded or excessive," the data subject should provide exact parameters: the date, the time window, the specific location of the incident, and the specific police station where they were detained (Wood Green).[54]

Target Law Enforcement Data	MPS Retention Policy and Action Required	Contact Point
999 Call Audio	31-day auto-delete (unless manually flagged for retention). Requires immediate Data Preservation Notice.[12]	MPS Data Rights Team (DataRights@met.police.uk) [53]
Body-Worn Video (BWV)	31-day auto-delete (unless manually flagged for evidence). Requires immediate Data Preservation Notice.[12]	MPS Data Rights Team (DataRights@met.police.uk) [53]
CAD Log & Radio Traffic	Retained indefinitely as a core operational record.[44]	MPS Data Rights Team (DataRights@met.police.uk) [53]
PACE Custody Record	Retained electronically on NSPIS/Connect systems.[46]	MPS Data Rights Team (DataRights@met.police.uk) [53]
PND/PNC Audit Trails	Retained electronically to monitor officer queries and data access.[25]	MPS Data Rights Team (DataRights@met.police.uk) [53]

The Legal Framework for Compelling the Release of Metadata

Large public organizations frequently attempt to fulfill Subject Access Requests by taking the path of least resistance: providing only the surface-level text of clinical notes or custody logs, completely ignoring the underlying metadata. The data subject's explicit desire to secure "every

single piece of metal data [metadata]" requires a legally precise formulation to compel the release of this backend information, preventing the agencies from claiming that extracting such data is technically impossible.

ICO Jurisprudence on Unstructured Data and Audit Logs

The UK Information Commissioner's Office (ICO) provides explicit, binding guidance on the Right of Access under the UK GDPR. The guidance conclusively confirms that the right of access extends to supplementary information, system metadata, and audit logs, provided that this data constitutes the individual's personal data or relates directly to the processing of their personal data.[19]

Furthermore, the ICO emphasizes that organizations operating automated processing systems for law enforcement purposes *must* legally keep logs of data collection, alteration, consultation, and disclosure.[34] This logging is not optional; it is a fundamental security and accountability requirement.

When framing the request to the NHS and the MPS, the data subject must state unequivocally that the audit logs and metadata are inextricably linked to their personal data. These logs track exactly who viewed, altered, and potentially weaponized their highly sensitive health and criminal records. By directly citing the ICO's guidance on accountability and logging mechanisms [34], the data subject signals a sophisticated understanding of database architecture. This severely limits the ability of the Hospital or Police Data Protection Officers to unlawfully dismiss the request for metadata as "manifestly unfounded or excessive".[35]

Anticipating and Preventing Redaction Abuse

Both the NHS Information Governance teams and the MPS Data Office will almost certainly attempt to heavily redact the disclosed documents, citing the protection of third-party personal data.[56] While third-party personal data (such as the names of unrelated patients in a hospital ward, or unrelated intelligence subjects in a police log) can be legitimately redacted under the UK GDPR, the identities of the public servants operating in their official capacity cannot.

The names, collar numbers, and professional user IDs of the nurses, doctors, arresting officers, and custody sergeants operating in their professional capacity generally cannot be withheld unless the organization can prove a credible, specific threat to their physical safety.[16] The data subject must proactively stipulate in their email that they expect the full names, badge numbers, and professional IDs of all staff appearing in the audit trails to remain entirely unredacted. This identification is absolutely vital for establishing accountability for the mishandled hate crime report and proving exactly who paraphrased the records.

The Erasure of Biometric Data: Navigating the ACRO Record Deletion Process

The data subject was taken to Wood Green Police Station under false pretenses and, while locked in a cell, was forced to provide highly sensitive biometric data, specifically DNA and

fingerprints. Under the Police and Criminal Evidence Act 1984 (PACE) as amended by the Protection of Freedoms Act 2012 (PoFA), the police possess the statutory power to take biometrics from individuals arrested for recordable offenses.[57]
However, PoFA 2012 introduced strict, legally binding limits on the retention of these biometrics, destroying the previous, widely criticized regime of blanket, indefinite data retention for unconvicted individuals.[58] Because the data subject was detained under false pretenses, the continued retention of their DNA profile, fingerprints, and PNC (Police National Computer) arrest record is entirely unlawful and severely prejudicial to their future prospects and civil liberties.[10]

The Administrative Mechanism of Biometric Deletion

The removal of this biometric data from national databases (specifically the National DNA Database, the National Fingerprint Database, and the Police National Computer) is managed through a formalized mechanism known as the **Record Deletion Process (RDP)**.[10] This process is administered nationally by the ACRO Criminal Records Office.[62]
It is crucial for the data subject to understand the architecture of this process: ACRO merely acts as the administrative conduit and clearinghouse.[10] Submitting an application to ACRO triggers a formal review process, but ACRO does not make the final decision. The ultimate statutory responsibility to delete or retain the data rests solely with the Chief Officer of the arresting force—in this specific case, the Commissioner of the Metropolitan Police.[10]

Establishing the Legal Grounds for Deletion

The National Police Chiefs' Council (NPCC) guidance outlines specific, exceptional circumstances under which a record deletion application will be approved.[60] For this data subject, the application must be forcefully argued under the following recognized statutory grounds [63]:

Statutory Deletion Ground	Application to the Data Subject's Case
Malicious / False Allegation	This ground applies directly to the user's assertion that they were framed for drug-induced psychosis or severe mental illness.[63] The application must detail how the initial, genuine report of a hate crime was maliciously inverted by the responding officers or third parties into a false allegation against the victim.
Mistaken Identity / Unlawful Arrest	Section 1 of PoFA 2012 explicitly mandates that a Chief Officer must destroy DNA and fingerprints if it appears they were taken unlawfully.[63] If the arrest lacked standard, objective reasonable grounds—because the

	victim of a hate crime was arbitrarily arrested without evidence—the arrest is fundamentally unlawful, rendering the subsequent biometric sampling unlawful.
No Crime	If it can be established through the CAD logs and 999 audio that the alleged drug-induced incident literally never occurred, and was a complete fabrication, this ground heavily applies.[63]

Executing the ACRO Record Deletion Application

The ACRO application process requires the data subject to submit a comprehensive explanation of the event, heavily supported by documentary evidence.[61] This highlights precisely why obtaining the 999 audio, the CAD log, the Body-Worn Video, and the system metadata *first* is strategically imperative.
Once the data subject possesses the unassailable digital proof of the interaction via their Subject Access Requests, they can append this pristine metadata to the ACRO Record Deletion application as irrefutable evidence of the false pretenses and unlawful arrest.[61] The NPCC guidelines stipulate a target turnaround time of 28 days for the relevant police force to review the deletion request, though complex cases involving simultaneous Professional Standards Department complaints may require extensions.[10]

Strategic Execution Guide and Drafting Parameters

To achieve the data subject's objectives without incurring additional trauma through drawn-out bureaucratic exchanges, the requests must be highly engineered, legally precise, and aggressively proactive. They must be sent simultaneously to the distinct legal entities, constantly reinforcing the digital-only mandate required under the Equality Act.

Parameter 1: The Digital-Only Equality Act Mandate

Every single submitted email and document must feature a prominent, bolded preamble invoking the Equality Act 2010. This preamble must assert:

- The sender is a British national residing in the UK, possessing a formal medical diagnosis of Complex Post-Traumatic Stress Disorder (C-PTSD).[7]
- Under Section 20 of the Equality Act 2010, the receiving authority (whether the MPS or Royal Free London) is legally required to make anticipatory reasonable adjustments for this disability.[8]
- The explicitly required adjustment is **exclusive, comprehensive digital communication via secure email**, utilizing the attached scanned passport as total proof of identity.
- There must be an absolute cessation of systemic "gaslighting" tactics: no delaying tactics, no requests to fill out proprietary web forms, and no repeated questioning, as such actions directly exacerbate the psychiatric impairment and constitute a failure to make

reasonable adjustments.[9]

Parameter 2: Royal Free London NHS Foundation Trust Execution

The data request must be directed to the Information Governance / Data Protection Officer for the Royal Free London group. A direct email incorporating the scanned passport and proof of address serves as a legally flawless SAR.[18]

The email must demand all clinical notes, psychiatric evaluations, A&E triage records, and discharge summaries from the specific date of admission at the North Middlesex University Hospital site.[2] Crucially, it must feature the **Metadata Mandate**: an explicit demand for the backend relational database audit trail demonstrating every single instance of file access. It must demand the user IDs of the staff involved, the exact timestamps of all edits, and the retrieval of any previous draft versions of clinical notes prior to the alleged "paraphrasing" during the shift changes.[34] Finally, it must request the audit logs of the London Care Record to determine the regional blast radius of the erroneous narrative.[38]

Parameter 3: Metropolitan Police Service Execution

This request must be sent immediately to DataRights@met.police.uk to beat the automated deletion scripts.[12]

The absolute first line of the email must be formatted as an urgent **DATA PRESERVATION NOTICE**, demanding the immediate freezing of the 31-day auto-delete script for all 999 audio and Body-Worn Video associated with the incident's specific location, date, and time window.[12]

The SAR must then list the target data: the raw 999 call audio, the full CAD log, all Body-Worn Video footage, radio transmissions, and the complete, unredacted PACE Custody Record generated at Wood Green Police Station.[12] To address the data subject's concerns regarding the leakage of "secondhand information" regarding their Irish ties, the request must specifically demand the internal audit logs showing any searches conducted on the subject's name in the Police National Computer (PNC) or Police National Database (PND).[24] This will trace exactly which officer pulled the historical data and when.

Conclusion

The mishandling of a hate crime report and the subsequent misclassification of the victim as suffering from a mental illness or drug-induced psychosis creates a highly toxic, rapidly propagating digital footprint. Left unchallenged, this erroneous data contaminates vast healthcare exchanges like the London Care Record and sophisticated law enforcement matrices like the Police National Database, posing severe ongoing risks to the individual's safety, mental health, and civil liberties.

However, the statutory frameworks in the United Kingdom—specifically the UK GDPR, the Data Protection Act 2018, and the Protection of Freedoms Act 2012—provide exceptionally powerful tools for remediation and accountability. By strategically coupling these data rights with the anticipatory duties required under the Equality Act 2010, an individual with C-PTSD can compel massive public institutions to yield their internal audit trails, metadata, and raw recordings

without enduring the bureaucratic friction designed to protect institutional liability. Immediate, legally precise action is required to halt the 31-day auto-deletion of crucial audio and video evidence held by the Metropolitan Police. Once preserved and extracted, this granular system metadata will serve as the definitive, unalterable proof required to expose the procedural failures to the Crown Prosecution Service, hold the relevant agencies accountable under the Victims' Code, and secure the total legal erasure of all unlawfully retained biometric data.
