

RSA and the Python module cs40d

Import the module, as usual:

```
from cs40d import *
```

Create an RSA cipher object:

```
R = RSA(ALPHABET64)
```

Set Keys, as needed:

```
n = ...
```

```
e = ...
```

```
d = ...
```

Encrypt /decrypt:

```
R.encrypt_string((n,e), [plaintext string])
```

```
R.decrypt_string((n,d), [ciphertext string])
```
